

- a) In the column “Title”, the most suitable string data type is varchar, because there are difference in the number of characters needed(Minions and Fantastic Four), so using varchar could help us to prevent waste of data.
- b) The primary key for this table would be a combination of Borrow\_Date and Client\_ID attributes, since each combination is unique(10 June- 123, 12 June\_567, 10 May-123, 12 May-123), and while Client\_Name could achieve same uniqueness when combining with Borrow\_Date, it is a longer string comparing with Client\_ID.
